OVERVIEW

Nuts are the retention half of every fastened joint on the car, and a single one backing off can free a suspension link or wheel. Thread size, pitch, and head style all have to match the application. Titanium and quality steel options let you cut weight where it counts or keep strength where it matters.

Fasteners are consumables that get replaced on teardown, so buying in sets is normal.

Locking half nut, 1/2-20 Inch thread. Hex head with nylon insert, steel with a black oxide finish. Set of 10.
