OVERVIEW

King pin sleeves are the bearing surface the spindle pivots on, carrying steering loads while allowing free rotation. A worn sleeve introduces play that shows up as vague steering and inconsistent front bite. Correct fit and material keep the pivot tight without binding.

Sleeves are wear parts, replaced as part of front end maintenance.

Camber adjustment is crucial for optimizing tire contact with the road surface, improving handling, and ensuring even tire wear. Ti22's camber sleeves keep the tires in the exact position they are set. Each.

SPECIFICATIONS
